

# The role of Nitsche type boundary conditions for edge stabilization and local projection method

Friedhelm Schieweck<sup>1</sup>

We investigate the edge stabilization method and the local projection method for higher order finite elements applied to a convection diffusion equation with a small diffusion parameter  $\varepsilon$ . Performing numerical experiments, it turns out that strongly imposed Dirichlet boundary conditions lead to relatively bad numerical solutions. However, if the Dirichlet boundary conditions are imposed on the inflow part of the boundary in a weak sense and additionally on the whole boundary in an  $\varepsilon$ -weighted weak sense due to Nitsche then one obtains reasonable numerical results. In many cases, this holds even in the limit case where the parameter of the edge stabilization is zero, i.e., where the standard Galerkin discretization is applied.
