Mixed fem-bem coupling for non-linear transmission problems with Signorini contact

Matthias Maischak

Here we generalize the approach in [4] and discuss an interface problem consisting of a non-linear partial differential equation in \( \Omega \subset \mathbb{R}^n \) (bounded, Lipschitz, \( n \geq 2 \)) and the Laplace equation in the unbounded exterior domain \( \Omega_c := \mathbb{R}^n \setminus \bar{\Omega} \) fulfilling some radiation condition, which are coupled by transmission conditions and Signorini conditions imposed on the interface. The interior PDE is discretized by a mixed formulation, whereas the exterior part of the interface problem is rewritten using a Neumann to Dirichlet mapping (NtD) given in terms of boundary integral operators.

We treat the general numerical approximation of the resulting variational inequality and discuss the non-trivial discretization of the NtD mapping. Assuming some abstract approximation properties and a discrete inf-sup condition we prove existence and uniqueness and show an a-priori estimate, which generalizes the results in [4]. Choosing Raviart-Thomas elements and piecewise constants in \( \Omega \) and hat functions on \( \partial \Omega \) the discrete inf-sup condition is satisfied [1]. We present a solver based on a modified Uzawa algorithm, reducing the solution procedure of the non-linear saddle point problem with an inequality constraint to the repeated solution of a standard non-linear saddle point problem and the solution of a variational inequality based on an elliptic operator. Finally, we present a residual based a-posteriori error estimator compatible with the Signorini condition and a corresponding adaptive scheme, see [5].

Some numerical experiments are shown which illustrate the convergence behavior of the uniform h-version with triangles and rectangles and the adaptive scheme as well as the bounded iteration numbers of the modified Uzawa algorithm, underlining the theoretical results.
